## 同步带

### Synchronous Belt

#### 产品特点 Product Features

同步带传动是利用带齿与带轮的啮合来传递动力的一种新型的传动方式，它兼有齿轮传动、链传动和带传动的各自优点。

The transmission of synchronous belt is a new transmission mode and transmits the dynamic force by the meshing of the belt teeth and pulley. It combines respective advantages of gear transmission, chain transmission and belt transmission.

#### 结构 Structure

编号No.	名称Name	功能Function	材料Material
1	顶胶 Top Rubber	保护内层抗张体 Protect the lining tensile member	CR HNBR
2	抗张体 Tensile Member	传递动力的核心材料 Core material to pass the dynamic force	玻纤 Glass Fiber
3	齿胶 Teeth Rubber	保护抗张体并保持胶带形状 Protect the tensile member and maintain the shape of the rubber	CR HNBR
4	齿布 Teeth Fabric	保持胶带和齿的形状 Maintain the shape of the adhesive tape and teeth	弹力布 Elastic Fabric

#### 特征 Feature

- 可以解决使用链条时发生的高速状态下传动效率降低，需注入润滑油等问题和使用齿轮时驱动部和从动部之间距离限制等问题
- 将玻璃纤维作为抗张体采用，无胶带的伸长
- 耐热、耐油、耐磨性出色
- 在运转速度和温度变化很大的条件下，也能保证很高的传动效率
- 高速旋转过程中，也能稳定安全的发挥其性能

- It may solve the problems such as low transmission efficiency and lubrication oil required under the status of high speed when using the chain, distance limit between the drive part and the slave drive part when using the gear.
- Glass fiber as tensile member, no elongation of rubber belt.
- Excellent heat-resistance, oil-proof, and wearing resistance
- Higher transmission efficiency can be guaranteed under the condition of large change of operation speed and temperature.
- Its performance can be exerted stably and safely during the process of high-speed rotation.
